Conclusions

The attending guests: They all have to:

$J_1$ ) Alice

$M_1$ ) have wine or pour tea

$J_2$ ) March Hare

$M_2$ ) spread butter

$J_3$ ) Dormouse

$M_3$ ) get a haircut

$J_4$ ) Mad Hatter.

$M_4$ ) check the time of the broken watch

$M_5$ ) say what they mean.

This can be considered as a typical  $4 \times 5$  job-shop, where:

- ★ our guests are the jobs
- ★ their tasks are the machines
- ★ objective is to minimise  $C_{\max}$  (when Alice can leave).

Conclusions

Performance of policy  $\pi$  compared with its optimal makespan, found using an expert policy,  $\pi_*$ , is the following loss function:

$$\rho = \frac{C_{\max}^{\pi} - C_{\max}^{\pi_*}}{C_{\max}^{\pi_*}} \cdot 100\%$$

The goal is to minimise this discrepancy between **predicted** value and **true** outcome.

Conclusions

Generating training data:

★ **Generate** feature set,  $\Phi \subset \mathcal{F}$ , both from

★ **optimal** solutions,  $\phi^o$

★ **suboptimal** solutions,  $\phi^s$

by exploring various **trajectories** within the feature-space  
(where  $\phi^o, \phi^s \in \mathcal{F}$ ).

★ Sample  $\Phi$  to create training set  $\Psi$  with rank pairs:

★ optimal decision,  $(z^o, y_o) = (\phi^o - \phi^s, +1)$

★ suboptimal decision,  $(z^s, y_s) = (\phi^s - \phi^o, -1)$

using different ranking schemes (where  $z^o, z^s \in \Psi$ )

★ Sample  $\Psi$  using stepwise bias for time independent policy.

## Conclusions

The thesis introduces a framework for learning (**linear**) composite priority dispatching rule – using **job-shop** as a case-study – with the following guidelines

- ★ For a given problem domain, use a suitable problem generator to train and test on.
- ★ Define features to grasp the essence of visited  $k$ -solutions
- ★ Success is highly dependent on the preference pairs introduced to the system:
  - ★  $\Psi_p$  reduces the preference set without loss of performance.
  - ★ Stepwise bias is needed to balance time dependent  $\Psi_p$  in order to create time independent models.

It is non intuitive how to go about collecting training data.

Conclusions

Continued from prev. slide:

- ★ Learning **optimal** trajectories predominant in literature. Study showed  $\Phi^{\text{OPT}}$  can result in **insufficient** knowledge.
- ★ Following sub-optimal deterministic policies, yet labelling with an optimal solver, improves the guiding policy.
- ★ Active update procedure using DAgger ensures sample states the learned model is likely to encounter is integrated to  $\Psi_p^{\text{DAI}}$ .
- ★ Instead of reusing the same problem instances, extend the training set with new instances for quicker convergence of DAgger.
- ★ In sequential decision making, all future observations are dependent on previous operations.
